SPOT DRENCH TEST

Do you know which species of worms are affecting your cattle and if your drenching strategy is providing effective control?

Knowing how effective your drenches are on your property & which worms to treat are pivotal in developing a drench strategy.

A drench test will provide the answers.

Benefits

Understanding the effectiveness of your cattle drench is critical for preventing unnecessary productivity losses and understanding if drench resistance is developing in your herd.

A 'Spot Drench Test' is a simple way to get the ball rolling, and can be performed during your next planned drenching.

It will provide the following:

- Confidence your drench is effective
- Knowledge of the parasite species affecting your cattle
- Check for drench resistance present in the herd
- Information to develop a more effective drench program
- Correct dosing and application methods
- Benchmark for future testing

It's Easy

A 'spot test' is simple to perform and only requires a small number of animals to have a fecal sample collected at the time of drenching, and again 14 days later.

The testing doesn't take long and is highly rewarding.
